

PROFIKOMPAKT

FOR EXTERNAL LUBRICATION

PROFIKOMPAKT

Flexible in the workshop

Mobile minimum quantity lubrication system for controlled and fine film application of fluids in the low-pressure range according to the injector principle.

The mobile spray unit is connected to the customer's compressed air line via a quick coupler and fastened with the magnetic base at the desired place of installation. The spray head is positioned via the accompanying bracket. A spray jet with a full cone of approx. 15° is created with little overspray at the spray head by switching the solenoid valve on and off.

Suitable for all fluids with a maximum viscosity of 100 mm²/s at 20 °C and 35 mm²/s at 40 °C (except for substances containing paint, resin and glue).

Our ProfiKompakt is also available with our precision drip-feed dosing device. Our drip-feed dosing device is the simplest way of applying liquid processing media such as cooling lubricants, oils, lubricants or dispersions precisely and accurately: economically – precisely – evenly and with a minimal impact on people and the environment!

TECHNICAL SPECIFICATIONS

- 1 Spray head or JOP connectable
- Container in size 1 liter
- Without Level control
- Control by default via toggle valve
- Optional control via magnetic or pneumatic valves
